### **Background of the Invention**

**[003]** This invention relates generally to wellbore casings, and in particular to wellbore casings that are formed using expandable tubing.

**[004]** Conventionally, when a wellbore is created, a number of casings are installed in the borehole to prevent collapse of the borehole wall and to prevent undesired outflow of drilling fluid into the formation or inflow of fluid from the formation into the borehole. The borehole is drilled in intervals whereby a casing which is to be installed in a lower borehole interval is lowered through a previously installed casing of an upper borehole interval. As a consequence of this procedure the casing of the lower interval is of smaller diameter than the casing of the upper interval. Thus, the casings are in a nested arrangement with casing diameters decreasing in downward direction. Cement annuli are provided between the outer surfaces of the casings and the borehole wall to seal the casings from the borehole wall. As a consequence of this nested arrangement a relatively large borehole diameter is required at the upper part of the wellbore. Such a large borehole diameter involves increased costs due to heavy casing handling equipment, large drill bits and increased volumes of drilling fluid and drill cuttings. Moreover, increased drilling rig time is involved due to required cement

pumping, cement hardening, required equipment changes due to large variations in hole diameters drilled in the course of the well, and the large volume of cuttings drilled and removed.

**[005]** The present invention is directed to overcoming one or more of the limitations of the existing procedures for forming wellbores and wellheads.

#### **Summary of the Invention**

**[006]** According to one aspect of the present invention, an apparatus for coupling a tubular member to a preexisting structure is provided that includes a radial expansion device for radially expanding the tubular member, and a milling device coupled to the radial expansion device for milling the radially expanded tubular member.

**[007]** According to another aspect of the present invention, an apparatus for coupling a tubular member to a preexisting structure is provided that includes a support member including a first fluid passage, an expansion cone coupled to the support member including a second fluid passage coupled to the first fluid passage, a milling device coupled to the expansion cone, a tubular member coupled to the expansion cone, an expansion cone launcher coupled to the tubular member, and a shoe coupled to the expansion cone launcher including a valveable fluid passage.

**[008]** According to another aspect of the present invention, an apparatus for coupling a tubular member to a preexisting structure is provided that includes a support member including a first fluid passage, an expansion cone coupled to the support member including a second fluid passage coupled to the first fluid passage, a milling device coupled to the expansion cone, a tubular member coupled to the expansion cone, and an anchoring device coupled to the tubular member.

**[009]** According to another aspect of the present invention, a method of coupling a tubular member to a preexisting structure is provided that includes radially expanding the tubular member within the preexisting structure, and simultaneously, machining the interior surface of the radially expanded tubular member.

**[0010]** According to another aspect of the present invention, a system for coupling a tubular member to a preexisting structure is provided that includes means for radially expanding the tubular member within the preexisting structure; and means for simultaneously machining the interior surface of the radially expanded tubular member.

**[0011]** According to another aspect of the present invention, a method of radially expanding and plastically deforming an expandable tubular assembly that includes an expandable tubular member and a shoe coupled to an end of the expandable tubular member is provided that includes radially expanding and plastically deforming at least a portion of the expandable tubular member and removing at least a portion of the shoe using a single tool.

**[0012]** According to another aspect of the present invention, a method of radially expanding and plastically deforming an expandable tubular assembly that includes an expandable tubular member and a shoe coupled to an end of the expandable tubular member is provided that includes positioning the expandable tubular member and shoe within a preexisting structure; positioning a tool within the expandable tubular member; and radially expanding and plastically deforming at least a portion of the expandable tubular member and removing at least a portion of the shoe without removing the tool from the preexisting structure.

**[0014]** FIG. 1B is a fragmentary cross-sectional view illustrating the injection of a fluidic material into the apparatus of FIG. 1A.

**[0015]** FIG. 1C is a fragmentary cross-sectional view illustrating the pressurization of the region below the expansion cone of the apparatus of FIG. 1B.

**[0016]** FIG. 1D is a fragmentary cross-sectional view illustrating the complete radial expansion of the expandable tubular member of the apparatus of FIG. 1C.

**[0017]** FIG. 1E is a fragmentary cross-sectional view illustrating the reinsertion of the apparatus of FIG. 1D into the radially expanded expandable tubular member.

**[0018]** FIG. 1F is a fragmentary cross-sectional view illustrating the milling out of the shoe of the apparatus of FIG. 1E.

**[0019]** FIG. 1G is a fragmentary cross-sectional view illustrating the completion of the milling out of the shoe using the apparatus of FIG. 1F.

**[0020]** FIG. 2A is a fragmentary cross-sectional view illustrating an alternate embodiment of an apparatus for creating and milling a casing within a well borehole.

**[0021]** FIG. 2B is a fragmentary cross-sectional view illustrating the complete radial expansion and milling of the expandable tubular member of the apparatus of FIG. 2A.

#### **Detailed Description of the Illustrative Embodiments**

**[0022]** An apparatus and method for forming a wellbore casing within a subterranean formation is provided. The apparatus and method provide a system for forming a wellbore casing within a subterranean formation in which a tubular member is simultaneously radially expanded and milled. In this manner, an expandable tubular diameter of optimum internal dimensions is provided using a single tool that remains within the wellbore until the completion of the operation. The system further permits a shoe to be removed using the same tool after the completion of the radial expansion operation. In several alternative embodiments, the system is used in combination with systems for radial expansion that push and/or pull an expansion cone through the expandable tubular member.

**[0023]** As illustrated in Fig. 1a, a wellbore 100 positioned within a subterranean formation 105 includes a preexisting casing 110 having one or more openings 115. The wellbore 100 may be oriented in any position from the vertical to the horizontal. The opening 115 may be formed in the casing 110 by a conventional production operation or by damage to the casing 110. As will be recognized by persons having ordinary skill in the art, and having the benefit of the present disclosure, in order to optimize subsequent production from the wellbore 100, the opening 115 may have to be sealed off.

**[0024]** In a preferred embodiment, as illustrated in FIG. 1a, an apparatus 200 for repairing a wellbore casing is positioned within the wellbore 100 in opposing relation to one or more of the openings 115. In a preferred embodiment, the apparatus 200 includes a support member 205, one or more sealing cups 210, an expansion cone 215, an expandable tubular member 220, an expansion cone launcher 225, a shoe 230, one or more sealing members 235, one or more one-way retaining members 240, a fluid passage 245, a fluid passage 250, a milling device 255, a hydraulic motor 260, and a valveable fluid passage 265. In a preferred embodiment, the apparatus 200 is adapted to repair and seal off one or more of the openings 115 in the wellbore casing 110. More generally, the apparatus 200 is used to form and/or repair wellbore casings, pipelines, and structural supports.

**[0025]** The support member 205 is preferably adapted to be coupled to a conventional surface support and the expansion cone 215. The support member 205 may be fabricated from any number of conventional commercially available tubular support members. In a preferred embodiment, the support member 205 is fabricated from alloy steel having a minimum yield strength of about 75,000 to 140,000 psi in order to provide high strength and resistance to abrasion and fluid erosion. In a preferred embodiment, the support member 205 further includes the fluid passages 245 and 250.

**[0026]** The sealing cups 210 are preferably coupled to the support member 205. The sealing cups 210 are preferably adapted to prevent foreign materials from entering the interior of the expandable tubular member 220.

**[0027]** The expansion cone 215 is preferably coupled to the support member 205 and the milling device 255. The expansion cone 215 is further preferably movably coupled to the expansion cone launcher 225 and the expandable tubular member 220. The expansion cone 215 preferably includes an annular member having one or more outer conical surfaces for engaging the inside diameter of the tubular member 220. In this manner, axial movement of the expansion cone 215 radially expands the tubular member 220. In a preferred embodiment, the expansion cone 215 is further provided substantially as described in one or more of the following: (1) U.S. Patent Number 6,497,289, which was filed as U.S. Patent Application serial no. 09/454,139, attorney docket no. 25791.03.02, filed on 12/3/1999, which claims priority from provisional application 60/111,293, filed on 12/7/98, (2) U.S. patent

**[0029]** The expansion cone launcher 225 is preferably coupled to the expandable tubular member 220 and the shoe 230. The expansion cone launcher 225 is further preferably movably coupled to the expansion cone 215 and the milling device 255. In a preferred embodiment, the expansion cone launcher 225 is adapted to house the expansion cone 215 and milling device 255 during placement of the apparatus 200 within the wellbore 100. In a

preferred embodiment, the wall thickness of the expansion cone launcher 225 is less than the wall thickness of the expandable tubular member 220 in order to optimally facilitate the initiation of the radial expansion of the expandable tubular member 220. In a preferred embodiment, the expansion cone launcher 225 is further provided substantially as disclosed in one or more of the following: (1) U.S. Patent Number 6,497,289, which was filed as U.S. Patent Application serial no. 09/454,139, attorney docket no. 25791.03.02, filed on 12/3/1999, which claims priority from provisional application 60/111,293, filed on 12/7/98, (2) U.S. patent application serial no. 09/510,913, attorney docket no. 25791.7.02, filed on 2/23/2000, which claims priority from provisional application 60/121,702, filed on 2/25/99, (3) U.S. patent application serial no. 09/502,350, attorney docket no. 25791.8.02, filed on 2/10/2000, which claims priority from provisional application 60/119,611, filed on 2/11/99, (4) U.S. patent no. 6,328,113, which was filed as U.S. Patent Application serial number 09/440,338, attorney docket number 25791.9.02, filed on 11/15/99, which claims priority from provisional application 60/108,558, filed on 11/16/98, (5) U.S. patent application serial no. 10/169,434, attorney docket no. 25791.10.04, filed on 7/1/02, which claims priority from provisional application 60/183,546, filed on 2/18/00, (6) U.S. patent application serial no. 09/523,468, attorney docket no. 25791.11.02, filed on 3/10/2000, which claims priority from provisional application 60/124,042, filed on 3/11/99, (7) U.S. patent number 6,568,471, which was filed as patent application serial no. 09/512,895, attorney docket no. 25791.12.02, filed on 2/24/2000, which claims priority from provisional application 60/121,841, filed on 2/26/99, (8) U.S. patent number 6,575,240, which was filed as patent application serial no. 09/511,941, attorney docket no. 25791.16.02, filed on 2/24/2000, which claims priority from provisional application 60/121,907, filed on 2/26/99, (9) U.S. patent number 6,557,640, which was filed as patent application serial no. 09/588,946, attorney docket no. 25791.17.02, filed on 6/7/2000, which claims priority from provisional application 60/137,998, filed on 6/7/99, (10) U.S. patent application serial no. 09/981,916, attorney docket no. 25791.18, filed on 10/18/01 as a continuation-in-part application of U.S. patent no. 6,328,113, which was filed as U.S. Patent Application serial number 09/440,338, attorney docket number 25791.9.02, filed on 11/15/99, which claims priority from provisional application 60/108,558, filed on 11/16/98, (11) U.S. patent number 6,604,763, which was filed as application serial no. 09/559,122, attorney docket no. 25791.23.02, filed on 4/26/2000, which claims priority from provisional application 60/131,106, filed on 4/26/99, (12) U.S. patent application serial no. 10/030,593, attorney docket no. 25791.25.08, filed on 1/8/02, which claims priority from provisional application 60/146,203, filed on 7/29/99, (13) U.S. provisional patent application serial no. 60/143,039, attorney docket no. 25791.26, filed on 7/9/99, (14) U.S. patent application serial no. 10/111,982, attorney docket no. 25791.27.08, filed on 4/30/02, which claims priority from provisional patent application serial no. 60/162,671, attorney docket no.

**[0031]** The sealing members 235 are preferably coupled to the outside surface of the expandable tubular member 220. The sealing members 235 are preferably adapted to seal

off the openings 115 in the wellbore casing 110 when the expandable tubular member 220 is radially expanded.

**[0032]** The fluid passage 245 is preferably fluidically coupled to the fluid passage 250 and a region within the wellbore 100 outside of the apparatus 200. The fluid passage 245 is preferably adapted to permit fluidic materials within the apparatus 200 to pass out of the apparatus 200 during the placement of the apparatus 200 within the wellbore 100. In this manner, surge pressures during placement of the apparatus 200 within the wellbore 100 are minimized. In a preferred embodiment, the fluid passage 245 includes a flow control valve that permits the fluid passage 245 to be closed.

**[0033]** The fluid passage 250 is preferably adapted to be fluidically coupled to a fluidic pump, controllably fluidically coupled to the fluid passage 245, and fluidically coupled to the fluid motor 260. The fluid passage 250 is preferably adapted to convey fluidic materials from a surface location to the inlet of the fluid motor 260.

**[0034]** The milling device 255 is preferably coupled to the bottom end portion of the expansion cone 215. The milling device 255 is further preferably powered by the fluid motor 260. The milling device 255 is preferably adapted to controllably mill the interior surface of the expandable tubular member 220. In this manner, the milling device 255 controllably mills the interior surface of the expandable tubular member 220 during the radial expansion process. The milling device 255 is further preferably adapted to mill and remove the shoe 230. In this manner, upon the completion of the radial expansion process, the milling device 255 is preferably used to remove the shoe 230. The milling device 255 may be any number of conventional commercially available milling devices.

**[0035]** The fluid motor 260 is preferably operably coupled to the milling device 255. The fluid motor 260 is preferably adapted to drive the milling device 255. The fluid motor 260 is preferably housed within the milling device 255. The fluid motor 260 is further fluidically coupled to the fluid passage 250. In a preferred embodiment, the inlet of the fluid motor 260 is fluidically coupled to the fluid passage 250 and the outlet of the fluid motor 260 exhausts fluidic materials into the region 270. The fluid motor 260 may be any number of conventional fluid motors.

**[0036]** In a preferred embodiment, the milling device 255 and fluid motor 260 are provided as a unitary device.

**[0037]** The valveable fluid passage 265 is preferably positioned within and passes through the shoe 230. The valveable fluid passage 265 is preferably adapted to permit fluidic materials to pass from the interior of the apparatus 200 to a region outside of the apparatus 200. The valveable fluid passage 265 is further preferably adapted to receive and mate with a plug, or other similar device, for closing the valveable fluid passage 265.

**[0038]** As illustrated in FIG. 1a, in a preferred embodiment, during placement of the apparatus 200 within the wellbore 100, fluidic materials within the wellbore 100 are conveyed via the fluid passage 265, the fluid motor 260, the fluid passage 250, and the fluid passage 245 to a location outside of the apparatus 200. In this manner, surge pressures are minimized during placement of the apparatus 200 within the wellbore 100.

**[0039]** As illustrated in FIG. 1b, in a preferred embodiment, fluidic materials 275 are then pumped into the fluid passage 250 in order to test the proper operation of the apparatus 200. In a preferred embodiment, the pumping of the fluidic materials 275 into the apparatus 200 drives the fluidic motor 260 that in turn drives the milling device 255.

**[0040]** As illustrated in FIG. 1c, in a preferred embodiment, a plug 280 is then introduced into the pumped fluidic materials 260. In a preferred embodiment, the plug 265 passes through the fluid passage 250 and the fluid motor 260 and is then subsequently positioned within a portion of the valveable fluid passage 255. In this manner, the valveable fluid passage 255 is closed. In a preferred embodiment, continued pumping of the fluidic material 260 pressurizes the region 270 below the milling device 255. In a preferred embodiment, the pressurization of the region 270 causes the expansion cone 215 to be axially displaced out of the wellbore 100. In this manner, the expandable tubular member 220 is radially expanded. In a preferred embodiment, the expandable tubular member 220 is radially expanded into intimate contact with the wellbore casing 110. In this manner, the openings 115 in the wellbore casing 110 are optimally sealed off by the sealing members 235.

**[0041]** In a preferred embodiment, during the continued radial expansion of the expandable tubular member 220 caused by the upward axial displacement of the expansion cone 215, the milling device 255 machines at least a portion the interior surface of the expandable tubular member 220 to a preselected final inside dimension. In this manner, the expandable tubular member 220 is simultaneously radially expanded and machined to a selected final inside dimension.

**[0042]** As illustrated in FIG. 1d, in a preferred embodiment, the complete radial expansion of the expandable tubular member 220 causes the sealing members 235 to seal off one or more of the openings 115 in the wellbore casing 110.

**[0043]** In a preferred embodiment, as illustrated in FIG. 1e, after completing the radial expansion of the expandable tubular member 220, the expansion cone 215 and milling device 255 are reinserted into the expandable tubular member 220 into intimate contact with the shoe 230 in order to utilize the milling device 255 to remove the shoe 230. In a preferred embodiment, during the reinsertion process, fluidic materials within the chamber 270 are exhausted using the fluid passages 250 and 245 in order to optimally facilitate the reinsertion of the expansion cone 215 and milling device 255. Alternatively, after completing the radial expansion of the expandable tubular member 220, the expansion cone 215 and milling

device 255 remain within the wellbore and are then positioned into intimate contact with the shoe 230 in order to utilize the milling device 255 to remove the shoe 230.

**[0044]** In a preferred embodiment, as illustrated in FIG. 1f, after positioning the milling device 255 in intimate contact with the shoe 230, a fluidic material is then injected into the fluid passage 250 in order to operate the fluidic pump 260. In a preferred embodiment, the operation of the fluidic pump 260 causes the milling device 255 to machine and remove the shoe 230.

**[0045]** In a preferred embodiment, as illustrated in FIG. 1g, after removing the shoe 230 using the milling device 255, the resulting new section of wellbore casing includes the radially expanded expandable tubular member 220 and the sealing members 235, both of which are coupled to the preexisting casing 110. In this manner, a single tool is used to: (1) radially expand the expandable tubular member; (2) mill the interior of the radially expanded tubular member to a preselected dimension; and (3) remove the shoe. In a particularly preferred embodiment, the single tool remains within the wellbore throughout the entire operation. In this manner, a cost efficient and highly effect system for forming and/or repairing wellbore casings is provided. More generally the apparatus 200 is used to form and/or repair wellbore casings, pipelines, and structural supports by radially expanding and coupling the expandable tubular member 220 to a preexisting structure.

**[0046]** In a preferred embodiment, the operation of the apparatus 200 is further provided substantially as described in one or more of the following: (1) U.S. Patent Number 6,497,289, which was filed as U.S. Patent Application serial no. 09/454,139, attorney docket no. 25791.03.02, filed on 12/3/1999, which claims priority from provisional application 60/111,293, filed on 12/7/98, (2) U.S. patent application serial no. 09/510,913, attorney docket no. 25791.7.02, filed on 2/23/2000, which claims priority from provisional application 60/121,702, filed on 2/25/99, (3) U.S. patent application serial no. 09/502,350, attorney docket no. 25791.8.02, filed on 2/10/2000, which claims priority from provisional application 60/119,611, filed on 2/11/99, (4) U.S. patent no. 6,328,113, which was filed as U.S. Patent Application serial number 09/440,338, attorney docket number 25791.9.02, filed on 11/15/99, which claims priority from provisional application 60/108,558, filed on 11/16/98, (5) U.S. patent application serial no. 10/169,434, attorney docket no. 25791.10.04, filed on 7/1/02, which claims priority from provisional application 60/183,546, filed on 2/18/00, (6) U.S. patent application serial no. 09/523,468, attorney docket no. 25791.11.02, filed on 3/10/2000, which claims priority from provisional application 60/124,042, filed on 3/11/99, (7) U.S. patent number 6,568,471, which was filed as patent application serial no. 09/512,895, attorney docket no. 25791.12.02, filed on 2/24/2000, which claims priority from provisional application 60/121,841, filed on 2/26/99, (8) U.S. patent number 6,575,240, which was filed as patent application serial no. 09/511,941, attorney docket no. 25791.16.02, filed on

**[0047]** Referring to FIG. 2a, in an alternative embodiment, an apparatus 300 for repairing a wellbore casing is positioned within the wellbore 100 in opposing relation to one or more of the openings 115. In a preferred embodiment, the apparatus 300 includes a support

member 305, an expansion cone 310, an expandable tubular member 315, an expansion cone launcher 320, one or more sealing members 325, one or more one-way retaining members 330, a fluid passage 335, a fluid pump 340, and a milling device 345. In a preferred embodiment, the apparatus 300 is adapted to repair and seal off one or more of the openings 115 in the wellbore casing 110. More generally, the apparatus 300 is used to form and/or repair wellbore casings, pipelines, and structural supports.

**[0048]** The support member 305 is preferably adapted to be coupled to a conventional surface support and the expansion cone 310. The support member 305 may be fabricated from any number of conventional commercially available tubular support members. In a preferred embodiment, the support member 305 is fabricated from alloy steel having a minimum yield strength of about 75,000 to 140,000 psi in order to provide high strength and resistance to abrasion and fluid erosion.

**[0049]** The expansion cone 310 is preferably coupled to the support member 305 and the milling device 345. The expansion cone 310 is further preferably movably coupled to the expansion cone launcher 320 and the expandable tubular member 315. The expansion cone 310 preferably includes one or more outer conical surfaces for engaging the inside diameter of the tubular member 315. In this manner, axial movement of the expansion cone 310 radially expands the expandable tubular member 315. In a preferred embodiment, the expansion cone 310 is further provided substantially as described in one or more of the following: (1) U.S. Patent Number 6,497,289, which was filed as U.S. Patent Application serial no. 09/454,139, attorney docket no. 25791.03.02, filed on 12/3/1999, which claims priority from provisional application 60/111,293, filed on 12/7/98, (2) U.S. patent application serial no. 09/510,913, attorney docket no. 25791.7.02, filed on 2/23/2000, which claims priority from provisional application 60/121,702, filed on 2/25/99, (3) U.S. patent application serial no. 09/502,350, attorney docket no. 25791.8.02, filed on 2/10/2000, which claims priority from provisional application 60/119,611, filed on 2/11/99, (4) U.S. patent no. 6,328,113, which was filed as U.S. Patent Application serial number 09/440,338, attorney docket number 25791.9.02, filed on 11/15/99, which claims priority from provisional application 60/108,558, filed on 11/16/98, (5) U.S. patent application serial no. 10/169,434, attorney docket no. 25791.10.04, filed on 7/1/02, which claims priority from provisional application 60/183,546, filed on 2/18/00, (6) U.S. patent application serial no. 09/523,468, attorney docket no. 25791.11.02, filed on 3/10/2000, which claims priority from provisional application 60/124,042, filed on 3/11/99, (7) U.S. patent number 6,568,471, which was filed as patent application serial no. 09/512,895, attorney docket no. 25791.12.02, filed on 2/24/2000, which claims priority from provisional application 60/121,841, filed on 2/26/99, (8) U.S. patent number 6,575,240, which was filed as patent application serial no. 09/511,941, attorney docket no. 25791.16.02, filed on 2/24/2000, which claims priority from provisional

**[0051]** The expansion cone launcher 320 is preferably coupled to the expandable tubular member 315. The expansion cone launcher 320 is further preferably movably coupled to the expansion cone 310 and the milling device 345. In a preferred embodiment, the expansion cone launcher 320 is adapted to house the expansion cone 310 and milling device 345 during placement of the apparatus 300 within the wellbore 100. In a preferred embodiment, the wall thickness of the expansion cone launcher 320 is less than the wall thickness of the expandable tubular member 315 in order to optimally facilitate the initiation of the radial expansion of the expandable tubular member 315. In a preferred embodiment, the expansion cone launcher 320 is further provided substantially as disclosed in one or more of the following: (1) U.S. Patent Number 6,497,289, which was filed as U.S. Patent Application serial no. 09/454,139, attorney docket no. 25791.03.02, filed on 12/3/1999, which claims priority from provisional application 60/111,293, filed on 12/7/98, (2) U.S. patent application serial no. 09/510,913, attorney docket no. 25791.7.02, filed on 2/23/2000, which claims priority from provisional application 60/121,702, filed on 2/25/99, (3) U.S. patent application serial no. 09/502,350, attorney docket no. 25791.8.02, filed on 2/10/2000, which claims priority from provisional application 60/119,611, filed on 2/11/99, (4) U.S. patent no. 6,328,113, which was filed as U.S. Patent Application serial number 09/440,338, attorney docket number 25791.9.02, filed on 11/15/99, which claims priority from provisional application 60/108,558, filed on 11/16/98, (5) U.S. patent application serial no. 10/169,434, attorney docket no. 25791.10.04, filed on 7/1/02, which claims priority from provisional

no. 25791.253.02, filed on 3/11/04, and (124) PCT patent application serial no. PCT/US04/\_\_\_\_\_, attorney docket no. 25791.236.02, filed on 3/15/04, the disclosures of which are incorporated herein by reference.

**[0052]** The sealing members 325 are preferably coupled to the outside surface of the expandable tubular member 315. The sealing members 325 are preferably adapted to seal off the openings 115 in the wellbore casing 110 when the expandable tubular member 315 is radially expanded.

**[0053]** The one-way retaining members 330 are preferably coupled to the exterior surface of the expansion cone launcher 320. The one-way retaining members 330 are preferably adapted to permit the apparatus 300 to be lowered into the wellbore 100. However, the one-way retaining members 330 are preferably adapted to controllably engage the wellbore casing 110 and substantially prevent the apparatus 300 from being raised out of the wellbore 100. In this manner, the one-way retaining members 330 optimally permit the expansion cone launcher 320 to be anchored within the wellbore 100. The one-way retaining members 330 may be any number of conventional one-way retaining members.

**[0054]** The fluid passage 335 is preferably adapted to be fluidically coupled to a surface pump and the fluid motor 340. The fluid passage 335 is preferably adapted to convey a pressurized fluid to the fluid motor 340. In this manner, the fluid motor 340 is preferably driven by pressurized fluidic materials conveyed by the fluid passage 335.

**[0055]** The fluid motor 340 is preferably operably coupled to the milling device 345. The fluid motor 340 is preferably adapted to drive the milling device 345. The fluid motor 340 is preferably housed within the milling device 345. The fluid motor 340 is further fluidically coupled to the fluid passage 335. In a preferred embodiment, the inlet of the fluid motor 340 is fluidically coupled to the fluid passage 335 and the outlet of the fluid motor 340 exhausts fluidic materials into the region 350. The fluid motor 340 may be any number of conventional fluid motors.

**[0056]** The milling device 345 is preferably coupled to the bottom end portion of the expansion cone 310. The milling device 345 is further preferably powered by the fluid motor 340. The milling device 345 is preferably adapted to controllably mill the interior surface of the expandable tubular member 315. In this manner, the milling device 345 controllably mills the interior surface of the expandable tubular member 315 during the radial expansion process. The milling device 345 may be any number of conventional commercially available milling devices.

**[0057]** In a preferred embodiment, the milling device 345 and fluid motor 340 are provided as a unitary device.

**[0058]** In a preferred embodiment, as illustrated in FIG. 2a, once the apparatus 300 has been positioned within the wellbore 100 in opposing relation to one or more of the openings

115, the one-way retaining members 330 prevent axial displacement of the expansion cone launcher in a direction out of the wellbore 100. In this manner, once the apparatus 300 has been positioned in the preselected location for coupling the expandable tubular member 315 to the wellbore casing 110, the position of the apparatus 300 is substantially fixed.

[0059] As illustrated in FIG. 2a, in a preferred embodiment, the expansion cone 310 is then pulled out of the wellbore 100 using the support member 305. In a preferred embodiment, while pulling the expansion cone 310 out of the borehole 100, the one-way retaining members 330 anchor the expansion cone launcher 320. In a preferred embodiment, the axial displacement of the expansion cone 310 radially expands the expandable tubular member 315. In a preferred embodiment, while pulling the expansion cone 310 out of the wellbore 100, a fluidic material 355 is simultaneously pumped into the fluid passage 335 in order to drive the fluid motor 340. In this manner, the fluidic motor 340 drives the milling device 345. In this manner, in a preferred embodiment, the interior surface of the expandable tubular member 315 is thereby machined to a preselected dimension while the expandable tubular member 315 is radially expanded. In this manner, an apparatus is provided that: (1) radially expands a tubular member; and, simultaneously, machines the interior surface of the tubular member during the radial expansion process.

[0060] As illustrated in FIG. 2b, in a preferred embodiment, the complete radial expansion of the expandable tubular member 315 causes the sealing members 325 to seal off one or more of the openings 115 in the wellbore casing 110. More generally the apparatus 300 is used to form and/or repair wellbore casings, pipelines, and structural supports by radially expanding and coupling the expandable tubular member 315 to a preexisting structure.

[0061] An apparatus for coupling a tubular member to a preexisting structure has been described that includes a radial expansion device for radially expanding the tubular member, and a milling device coupled to the radial expansion device for milling the radially expanded tubular member. In a preferred embodiment, the radial expansion device includes an expansion cone adapted to be axially displaced relative to the tubular member. In a preferred embodiment, the radial expansion device further includes a shoe coupled to the tubular member. In a preferred embodiment, the radial expansion device further includes an expansion cone launcher coupled to the tubular member. In a preferred embodiment, the milling device includes a fluid motor. In an exemplary embodiment, the radial expansion device is a rotary expansion device. In an exemplary embodiment, the radial expansion device is an adjustable expansion device. In an exemplary embodiment, the radial expansion device is a hydro-forming device.

[0062] An apparatus for coupling a tubular member to a preexisting structure has also been described that includes a support member including a first fluid passage, an expansion cone coupled to the support member including a second fluid passage coupled to the first fluid

passage, a milling device coupled to the expansion cone, a tubular member coupled to the expansion cone, an expansion cone launcher coupled to the tubular member, and a shoe coupled to the expansion cone launcher including a valveable fluid passage.

**[0063]** An apparatus for coupling a tubular member to a preexisting structure has also been described that includes a support member including a first fluid passage, an expansion cone coupled to the support member including a second fluid passage coupled to the first fluid passage, a milling device coupled to the expansion cone, a tubular member coupled to the expansion cone, and an anchoring device coupled to the tubular member.

**[0064]** A method of coupling a tubular member to a preexisting structure has also been described that includes radially expanding the tubular member within the preexisting structure and simultaneously, machining the interior surface of the radially expanded tubular member. In a preferred embodiment, radially expanding includes pulling an expansion cone through the tubular member. In a preferred embodiment, radially expanding includes pushing the expansion cone through the tubular member. In a preferred embodiment, pushing includes pushing using fluid pressure. In an exemplary embodiment, radially expanding the tubular member within the preexisting structure includes rotating an expansion device within the tubular member. In an exemplary embodiment, radially expanding the tubular member within the preexisting structure includes adjusting the size of an expansion device. In an exemplary embodiment, radially expanding the tubular member within the preexisting structure includes pressurizing the interior of the tubular member.

**[0065]** A system for coupling a tubular member to a preexisting structure has been described that includes means for radially expanding the tubular member within the preexisting structure; and means for simultaneously machining the interior surface of the radially expanded tubular member. In an exemplary embodiment, means for radially expanding includes means for pulling an expansion cone through the tubular member. In an exemplary embodiment, means for radially expanding includes means for pushing the expansion cone through the tubular member. In an exemplary embodiment, means for pushing includes means for pushing using fluid pressure. In an exemplary embodiment, means for radially expanding the tubular member within the preexisting structure includes means for rotating an expansion device within the tubular member. In an exemplary embodiment, means for radially expanding the tubular member within the preexisting structure includes means for adjusting the size of an expansion device. In an exemplary embodiment, means for radially expanding the tubular member within the preexisting structure includes means for pressurizing the interior of the tubular member.

**[0066]** A method of radially expanding and plastically deforming an expandable tubular assembly that includes an expandable tubular member and a shoe coupled to an end of the expandable tubular member has been described that includes radially expanding and

plastically deforming at least a portion of the expandable tubular member and removing at least a portion of the shoe using a single tool.

**[0067]** A method of radially expanding and plastically deforming an expandable tubular assembly that includes an expandable tubular member and a shoe coupled to an end of the expandable tubular member has been described that includes positioning the expandable tubular member and shoe within a preexisting structure; positioning a tool within the expandable tubular member; and radially expanding and plastically deforming at least a portion of the expandable tubular member and removing at least a portion of the shoe without removing the tool from the preexisting structure.

**[0068]** Although illustrative embodiments of the invention have been shown and described, a wide range of modification, changes and substitution is contemplated in the foregoing disclosure. For example, in several exemplary embodiments, rotary expansion devices such as, for example, the rotary expansion devices commercially available from Weatherford International and/or conventional hydro-forming methods and/or devices may be substituted for, or used in combination with, the expansion cones, 215 and 310. Furthermore, in several exemplary embodiments, the expansion cones, 215 and 310, are displaced relative to the expandable tubular members using fluid pressure and/or by pushing and/or pulling the expansion cones through the expandable tubular members. In addition, the teaching of the present application may be applied to the construction and/or repair of wellbore casings, pipelines and/or structural supports. In some instances, some features of the present invention may be employed without a corresponding use of the other features. Accordingly, it is appropriate that the appended claims be construed broadly and in a manner consistent with the scope of the invention.

### Claims

What is claimed is:

1. An apparatus for coupling a tubular member to a preexisting structure, comprising:  
a radial expansion device for radially expanding the tubular member; and  
a milling device coupled to the radial expansion device for milling the radially expanded tubular member.
2. The apparatus of claim 1, wherein the radial expansion device comprises:  
an expansion cone adapted to be axially displaced relative to the tubular member.
3. The apparatus of claim 2, wherein the radial expansion device further comprises:  
a shoe coupled to the tubular member.
4. The apparatus of claim 2, wherein the radial expansion device further comprises:  
an expansion cone launcher coupled to the tubular member.
5. The apparatus of claim 1, wherein the milling device comprises a fluid motor.
6. The apparatus of claim 1, wherein the radial expansion device comprises a rotary expansion device.
7. The apparatus of claim 1, wherein the radial expansion device comprises an adjustable expansion device.
8. The apparatus of claim 1, wherein the radial expansion device comprises a hydro-forming device.
9. An apparatus for coupling a tubular member to a preexisting structure, comprising:  
a support member including a first fluid passage;  
an expansion cone coupled to the support member including a second fluid passage  
coupled to the first fluid passage;  
a milling device coupled to the expansion cone;  
a tubular member coupled to the expansion cone;  
an expansion cone launcher coupled to the tubular member; and  
a shoe coupled to the expansion cone launcher including a valveable fluid passage.

10. An apparatus for coupling a tubular member to a preexisting structure, comprising:  
a support member including a first fluid passage;  
an expansion cone coupled to the support member including a second fluid passage  
coupled to the first fluid passage;  
a milling device coupled to the expansion cone;  
a tubular member coupled to the expansion cone; and  
an anchoring device coupled to the tubular member.
11. A method of coupling a tubular member to a preexisting structure, comprising:  
radially expanding the tubular member within the preexisting structure; and  
simultaneously machining the interior surface of the radially expanded tubular  
member.
12. The method of claim 11, wherein radially expanding comprises:  
pulling an expansion cone through the tubular member.
13. The method of claim 11, wherein radially expanding comprises:  
pushing the expansion cone through the tubular member.
14. The method of claim 13, wherein pushing comprises:  
pushing using fluid pressure.
15. The method of claim 11, wherein radially expanding the tubular member within the  
preexisting structure comprises rotating an expansion device within the tubular member.
16. The method of claim 11, wherein radially expanding the tubular member within the  
preexisting structure comprises adjusting the size of an expansion device.
17. The method of claim 11, wherein radially expanding the tubular member within the  
preexisting structure comprises pressurizing the interior of the tubular member.
18. A system for coupling a tubular member to a preexisting structure, comprising:  
means for radially expanding the tubular member within the preexisting structure; and  
means for simultaneously machining the interior surface of the radially expanded  
tubular member.
19. The system of claim 18, wherein means for radially expanding comprises:

means for pulling an expansion cone through the tubular member.

20. The system of claim 18, wherein means for radially expanding comprises:  
means for pushing the expansion cone through the tubular member.
21. The system of claim 20, wherein means for pushing comprises:  
means for pushing using fluid pressure.
22. The system of claim 18, wherein means for radially expanding the tubular member within the preexisting structure comprises means for rotating an expansion device within the tubular member.
23. The system of claim 18, wherein means for radially expanding the tubular member within the preexisting structure comprises means for adjusting the size of an expansion device.
24. The system of claim 18, wherein means for radially expanding the tubular member within the preexisting structure comprises means for pressurizing the interior of the tubular member.
25. A method of radially expanding and plastically deforming an expandable tubular assembly that includes an expandable tubular member and a shoe coupled to an end of the expandable tubular member, comprising:  
radially expanding and plastically deforming at least a portion of the expandable tubular member and removing at least a portion of the shoe using a single tool.
26. A method of radially expanding and plastically deforming an expandable tubular assembly that includes an expandable tubular member and a shoe coupled to an end of the expandable tubular member, comprising:  
positioning the expandable tubular member and shoe within a preexisting structure;  
positioning a tool within the expandable tubular member; and  
radially expanding and plastically deforming at least a portion of the expandable tubular member and removing at least a portion of the shoe without removing the tool from the preexisting structure.
